Why is transition important?

Preparation is crucial for studying A levels. A levels require you to be an independent learner. Although you have fewer subjects, A levels require different study skills and the volume of work is greater due to the increased demand of depth and detail. The exercises in this booklet will ensure that you are ready for the exciting challenges of becoming an A level Mathematics student in September. You should complete the questions from the booklet in your own note pad, exercise book or on paper. Those topics with a highlighted star are the priority topics and are things that will not be retaught but will be assumed knowledge for the A level course.

Is the transition work checked?

Yes. In September you will be expected to bring ALL your transition work with you to your first few lessons. This will be shown to the Maths team leader in charge of A level. You will be required to sit a baseline assessment in the first week to see if you are unable to demonstrate a sound understanding of the majority of content covered in this booklet. If you do not pass the baseline assessment, you will need to complete extra work and then sit a retest at a time arranged, this will be after school.

YOU MUST SHOW YOUR WORKING OUT.

You must bring all the work with you to your first few lessons in Year 12 Mathematics lesson in September.

Please ensure that all your work is marked and you have made any corrections and figure out why you were wrong

How is this booklet structured?

When you have completed each section use the answer booklet to mark your work. When you have gone wrong retry the question until you are able to get the correct answer.

Expanding brackets and simplifying expressions

Key points

- When you expand one set of brackets you must multiply everything inside the bracket by what is outside.
- When you expand two linear expressions, each with two terms of the form $ax + b$, where $a \neq 0$ and $b \neq 0$, you create four terms. Two of these can usually be simplified by collecting like terms.

Examples

Example 1 Expand $4(3x - 2)$ $4(3x-2) = 12x-8$ Multiply everything inside the bracket by the 4 outside the bracket **Example 2** Expand and simplify $3(x + 5) - 4(2x + 3)$ $3(x+5) - 4(2x+3)$ $= 3x + 15 - 8x - 12$ $= 3 - 5x$ **1** Expand each set of brackets separately by multiplying $(x + 5)$ by 3 and $(2x + 3)$ by -4 **2** Simplify by collecting like terms: 3*x* − 8*x* = −5*x* and 15 − 12 = 3 **Example 3** Expand and simplify $(x + 3)(x + 2)$ $(x + 3)(x + 2)$ $= x(x + 2) + 3(x + 2)$ $= x^2 + 2x + 3x + 6$ $= x^2 + 5x + 6$ **1** Expand the brackets by multiplying (*x* + 2) by *x* and (*x* + 2) by 3 **2** Simplify by collecting like terms: $2x + 3x = 5x$ **Example 4** Expand and simplify $(x - 5)(2x + 3)$ $(x-5)(2x+3)$ $= x(2x + 3) - 5(2x + 3)$ $= 2x^2 + 3x - 10x - 15$ $= 2x^2 - 7x - 15$ **1** Expand the brackets by multiplying (2*x* + 3) by *x* and (2*x* + 3) by −5 **2** Simplify by collecting like terms: $3x - 10x = -7x$

8 Expand and simplify.

<u> 1989 - Johann Barn, mars ar breithinn ar breithinn ar breithinn ar breithinn ar breithinn ar breithinn ar br</u>

Extend

- **9** Expand and simplify $(x + 3)^2 + (x 4)^2$
- **10** Expand and simplify.

$$
\mathbf{a} \qquad \left(x + \frac{1}{x}\right)\left(x - \frac{2}{x}\right) \qquad \mathbf{b} \qquad \left(x + \frac{1}{x}\right)^2
$$

Factorising expressions

Key points

- Factorising an expression is the opposite of expanding the brackets.
- A quadratic expression is in the form $ax^2 + bx + c$, where $a \ne 0$.
- To factorise a quadratic equation find two numbers whose sum is *b* and whose product is *ac*.
- An expression in the form $x^2 y^2$ is called the difference of two squares. It factorises to $(x - y)(x + y).$

Examples

Example 1 Factorise $15x^2y^3 + 9x^4y$

Example 2 Factorise $4x^2 - 25y^2$

Example 3 Factorise $x^2 + 3x - 10$

Example 4 Factorise $6x^2 - 11x - 10$

² − 4*x* − 21 **Example ⁵** Simplify *^x* ² + 9*x* + 9 2*x* **1** Factorise the numerator and the ² − 4*x* − 21 *x* denominator ² + 9*x* + 9 2*x* For the numerator: **2** Work out the two factors of *b* = −4, *ac* = −21 *ac* = −21 which add to give *b* = −4 (−7 and 3) So *x* ² − 4*x* – 21 = *x* ² − 7*x* + 3*x* – 21 **3** Rewrite the *b* term (−4*x*) using these two factors **4** Factorise the first two terms and the = *x*(*x* − 7) + 3(*x* − 7) last two terms **5** (*x* − 7) is a factor of both terms = (*x* – 7)(*x* + 3) **6** Work out the two factors of For the denominator: *b* = 9, *ac* = 18 *ac* = 18 which add to give *b* = 9 (6 and 3) So ² + 9*x* + 9 = 2*x* ² + 6*x* + 3*x* + 9 **7** Rewrite the *b* term (9*x*) using these 2*x* two factors **8** Factorise the first two terms and the = 2*x*(*x* + 3) + 3(*x* + 3) last two terms **9** (*x* + 3) is a factor of both terms = (*x* + 3)(2*x* + 3) So ² − 4*x* − 21 (*x* − 7)(*x* + 3) *x* **10** (*x* + 3) is a factor of both the = 2*x* ² + 9*x* + 9 (*x* + 3)(2*x* + 3) numerator and denominator so cancels out as a value divided by *x* − 7 = itself is 12*x* + 3

7 Simplify $\sqrt{x^2 + 10x + 25}$

8 Simplify
$$
\frac{(x+2)^2 + 3(x+2)^2}{x^2 - 4}
$$

Take the highest common factor outside the bracket.

Key points

• $a^m \times a^n = a^{m+n}$

$$
\bullet \quad \frac{a^m}{a^n} = a^{m-n}
$$

- $(a^m)^n = a^{mn}$
- $a^0 = 1$
- \bullet $\frac{1}{a^n}$ $a^n = \sqrt[n]{a}$ i.e. the *n*th root of *a*

•
$$
a^{\frac{m}{n}} = \sqrt[n]{a^m} = (\sqrt[n]{a})^m
$$

• $a^{-m} = \frac{1}{n}$

m a

• The square root of a number produces two solutions, e.g. $\sqrt{16} = \pm 4$.

Examples

Example 1 Evaluate 10^0

Example 2 92

Example 3 Evaluate

273

2

1

Example 4 4^{-2}

$$
4^{-2} = \frac{1}{4^2}
$$

1 Use the rule $a^{-m} = \frac{1}{a^m}$
2 Use $4^2 = 16$

m

 $=a^{m-n}$ to

n $\frac{a}{a}$ = a *a*

Example 5 Simplify
$$
\frac{6x^5}{2x^2}
$$

$$
\frac{6x^5}{2x^2} = 3x^3
$$

$$
\left(\frac{6x^5}{2x^2}\right)^2 = 3x^3
$$

$$
\left(\frac{6 \div 2}{2x^2}\right)^2 = x^5 - 2 = x^3
$$

Example 6 Simplify
$$
\frac{x^3 \times x^5}{x^4}
$$

$$
\frac{x^3 \times x^5}{x^4} = \frac{x^{3+5}}{x^4} = \frac{x^8}{x^4}
$$
\n1 Use the rule $a^m \times a^n = a^{m+n}$
\n2 Use the rule $\frac{a^m}{a^n} = a^{m-n}$

Example 7

1 $\frac{1}{3x}$ as a single power of *x*

Example 8

4 $\frac{1}{x}$ as a single power of *x*

$$
\frac{4}{\sqrt{x}} = \frac{4}{x^{\frac{1}{2}}}
$$
\n
$$
= 4x^{-\frac{1}{2}}
$$
\n1 Use the rule $a^{\frac{1}{n}} = \sqrt[n]{a}$
\n2 Use the rule $\frac{1}{a^m} = a^{-m}$

6 Evaluate.

a
$$
4^{-\frac{1}{2}}
$$
 b $27^{-\frac{2}{3}}$ **c** $9^{-\frac{1}{2}} \times 2^3$
d $16^{\frac{1}{4}} \times 2^{-3}$ **e** $\left(\frac{9}{16}\right)^{-\frac{1}{2}}$ **f** $\left(\frac{27}{64}\right)^{-\frac{2}{3}}$

7 Write the following as a single power of *x*.

a
$$
\frac{1}{x}
$$
 b $\frac{1}{x^7}$ **c** $\sqrt[4]{x}$
d $\sqrt[5]{x^2}$ **e** $\frac{1}{\sqrt[3]{x}}$ **f** $\frac{1}{\sqrt[3]{x^2}}$

8 Write the following without negative or fractional powers.

a
$$
x^{-3}
$$
 b x^0 **c** $x^{\frac{1}{5}}$
d $x^{\frac{2}{5}}$ **e** $x^{-\frac{1}{2}}$ **f** $x^{\frac{-3}{4}}$

9 Write the following in the form *axⁿ* .

a
$$
5\sqrt{x}
$$
 b $\frac{2}{x^3}$ **c** $\frac{1}{3x^4}$
d $\frac{2}{\sqrt{x}}$ **e** $\frac{4}{\sqrt[3]{x}}$ **f** 3

Extend

10 Write as sums of powers of *x*.

a
$$
\frac{x^5+1}{x^2}
$$
 b $x^2\left(x+\frac{1}{x}\right)$ **c** $x^{-4}\left(x^2+\frac{1}{x^3}\right)$

Surds

Key points – Surds

- A surd is the square root of a number that is not a square number, for example $\sqrt{2}$, $\sqrt{3}$, $\sqrt{4}$, etc.
- Surds can be used to give the exact value for an answer.

•
$$
\sqrt{ab} = \sqrt{a} \times \sqrt{b}
$$

•
$$
\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}
$$

- To rationalise the denominator means to remove the surd from the denominator of a fraction.
- To rationalise *^a b* you multiply the numerator and denominator by the surd $\;\surd b$
- To rationalise *^a* $b + \sqrt{c}$ you multiply the numerator and denominator by *b*− *c*

Examples

Example 2 Simplify $\sqrt{147} - 2\sqrt{12}$

Example 3 Simplify $(\sqrt{7} + \sqrt{2})(\sqrt{7} - \sqrt{2})$

Example 4 Rationalise
$$
\frac{1}{\sqrt{3}}
$$

\n
$$
\frac{1}{\sqrt{3}} = \frac{1}{\sqrt{3}} \times \frac{\sqrt{3}}{\sqrt{3}}
$$
\n
$$
= \frac{1 \times \sqrt{3}}{\sqrt{9}}
$$
\n
$$
= \frac{\sqrt{3}}{3}
$$
\n
$$
= \frac{\sqrt{3}}{3}
$$
\n
$$
1 \text{ Multiply the numerator and denominator by } \sqrt{3}
$$
\n
$$
2 \text{ Use } \sqrt{9} = 3
$$

Example 5 Rationalise and simplify
$$
\frac{\sqrt{2}}{\sqrt{12}}
$$

\n
$$
\frac{\sqrt{2}}{\sqrt{12}} = \frac{\sqrt{2} \times \sqrt{12}}{\sqrt{12}} \times \frac{\sqrt{12}}{\sqrt{12}}
$$
\n
$$
= \frac{\sqrt{2} \times \sqrt{4 \times 3}}{12}
$$
\n
$$
= \frac{2\sqrt{2}\sqrt{3}}{12}
$$
\n
$$
= \frac{2\sqrt{2}\sqrt{3}}{12}
$$
\n
$$
= \frac{\sqrt{2}\sqrt{3}}{6}
$$
\n
$$
= \frac{2\sqrt{3}}{6}
$$
\n
$$

$$

Practice

Change the subject of each formula to the letter given in the brackets.

2

3 − *a*

- **1** $C = \pi d$ [*d*] **2** $P = 2l + 2w$ [*w*] **3** $D = \frac{S}{S}$
- **4** $p = \frac{q r}{r}$ *t* $[t]$ **5** $u = at - \frac{1}{-t} [t]$ **6** $V = ax + 4x [x]$
- **7** $\frac{y-7x}{2} = \frac{7-2y}{2}$ 2 3 [y] **8** $x = \frac{2a-1}{2}$
- **10** $h = \frac{7g 9}{4}$ $2 + g$ $[g]$ **11** $e(9+x)=2e+1$ $[e]$ **12** $y=\frac{2x+3}{1}$

Changing the subject Advanced changing the subject

T

d

 $[a]$ **9** $x = \frac{b-c}{1}$

[*T*]

[*d*]

 $\frac{2x+6}{4-x}$ [x]

13 Make *r* the subject of the following formulae.

a
$$
A = \pi r^2
$$
 b $V = \frac{4}{3}\pi r^3$ **c** $P = \pi r + 2r$ **d** $V = \frac{2}{3}\pi r^2 h$

14 Make *x* the subject of the following formulae.

a
$$
\frac{xy}{z} = \frac{ab}{cd}
$$
 b $\frac{4\pi cx}{d} = \frac{3z}{py^2}$

15 Make sin *B* the subject of the formula $\frac{a}{b}$ sin *A* $=\frac{b}{\cdot}$ sin *B*

16 Make cos *B* the subject of the formula $b^2 = a^2 + c^2 - 2ac \cos B$.

Extend

17 Make *x* the subject of the following equations.

a
$$
\frac{p}{q}(sx+t) = x-1
$$
 b $\frac{p}{q}(ax+2y) = \frac{3p}{q^2}(x-y)$

Completing the square

Key points

- Completing the square for a quadratic rearranges $ax^2 + bx + c$ into the form $p(x + q)^2 + r$
- If $a \neq 1$, then factorise using *a* as a common factor.

Examples

Example 1 Complete the square for the quadratic expression $x^2 + 6x - 2$

$$
2x^2 - 5x + 1
$$

\n
$$
2x^2 - 5x + 1
$$

\n1 Before completing the square write
\n $ax^2 + bx + c$ in the form
\n $a\left(x^2 + \frac{b}{a}\right) + c$
\n2 Now complete the square by writing
\n $x^2 - \frac{5}{2}x$ in the form
\n $\left(x + \frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2$
\n
$$
= 2\left[\left(x - \frac{5}{4}\right)^2 - \left(\frac{5}{4}\right)^2\right] + 1
$$

\n3 Expand the square brackets - don't
\nforget to multiply $\left(\frac{5}{4}\right)^2$ by the
\nfactor of 2
\n3 Simplify
\n
$$
= 2\left(x - \frac{5}{4}\right)^2 - \frac{25}{8} + 1
$$

\n4 Simplify

Extend

4 Write $(25x^2 + 30x + 12)$ in the form $(ax + b)^2 + c$.

Solving quadratic equations by factorisation

Key points

- A quadratic equation is an equation in the form $ax^2 + bx + c = 0$ where $a \ne 0$.
- To factorise a quadratic equation find two numbers whose sum is *b* and whose products is *ac*.
- When the product of two numbers is 0, then at least one of the numbers must be 0.
- If a quadratic can be solved it will have two solutions (these may be equal).

Examples

Example 1 Solve $5x^2 = 15x$

Example 2 Solve $x^2 + 7x + 12 = 0$

Example 3 Solve $9x^2 - 16 = 0$

Example 4 Solve $2x^2 - 5x - 12 = 0$

Solving quadratic equations by completing the square

Key points

• Completing the square lets you write a quadratic equation in the form $p(x + q)^2 + r = 0$.

Examples

Video tutorials

Solving quadratic equations by completing the square

or click on the QR code to follow the hyperlink

Practice

- **3** Solve by completing the square.
	- **a** $x^2 4x 3 = 0$ **b** *x*
	- **c** $x^2 + 8x 5 = 0$ **d** *x*
	- **e** $2x^2 + 8x 5 = 0$ **f** 5*x*
- **b** $x^2 10x + 4 = 0$ **d** $x^2 - 2x - 6 = 0$ f $5x^2 + 3x - 4 = 0$
- 4 Sol e by completing the square.
	- **a** $(x-4)(x+2) = 5$
	- **b** $2x^2 + 6x 7 = 0$ Get all terms
	- **c** $x^2 5x + 3 = 0$ onto one side

of the

Solving quadratic equations by using the formula

Key points

• Any quadratic equation of the form $ax^2 + bx + c = 0$ can be solved using the formula −*b b* ² − 4*ac*

$$
x = \frac{-b \pm \sqrt{b^2 - 4a}}{2a}
$$

- If $b^2 4ac$ is negative then the quadratic equation does not have any real solutions.
- It is useful to write down the formula before substituting the values for *a*, *b* and *c*.

Examples

Example 7 Solve $x^2 + 6x + 4 = 0$. Give your solutions in surd form.

$a = 1, b = 6, c = 4$	1 Identify <i>a</i> , <i>b</i> and <i>c</i> and write down the formula.
$x = \frac{-6 \pm \sqrt{6^2 - 4(1)(4)}}{2a}$	1 Identify <i>a</i> , <i>b</i> and <i>c</i> and write down the formula.
$x = \frac{-6 \pm \sqrt{6^2 - 4(1)(4)}}{2(1)}$	2 Substitute <i>a</i> = 1, <i>b</i> = 6, <i>c</i> = 4 into the formula.
$x = \frac{-6 \pm \sqrt{20}}{2}$	3 Simplify. The denominator is 2, but this is only because <i>a</i> = 1. The denominator will not always be 2.
$x = \frac{-6 \pm 2\sqrt{5}}{2}$	4 Simplify $\sqrt{20}$.
$x = -3 \pm \sqrt{5}$	5 Simplify by dividing numerator and denominator by 2.
$\text{So } x = -3 - \sqrt{5} \text{ or } x = \sqrt{5} - 3$	6 Write down both the solutions.

Example 8 Solve $3x^2 - 7x - 2 = 0$. Give your solutions in surd form.

$$
a = 3, b = -7, c = -2
$$
\n
$$
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
$$
\n
$$
x = \frac{-(-7) \pm \sqrt{(-7)^2 - 4(3)(-2)}}{2(3)}
$$
\n
$$
x = \frac{7 \pm \sqrt{73}}{6}
$$
\n
$$
x = \frac{7 - \sqrt{73}}{6}
$$
\n
$$
a = 3, b = -7, c = -2
$$
\n
$$
a = 3, b = -7, c = -2
$$
\n
$$
a = 3, b = -7, c = -2
$$
\n
$$
a = 3, b = -7, c = -2
$$
\n
$$
a = 3, b = -7, c = -2
$$
\n
$$
a = 3, b = -7, c = -2
$$
\n
$$
a = 3, a \text{ common mistake is to always write a denominator of 2.}
$$
\n
$$
a = 3, a \text{ common mistake is to always write a denominator of 2.}
$$

Practice

Extend

8 Choose an appropriate method to solve each quadratic equation, giving your answer in surd form when necessary.

a $4x(x-1) = 3x-2$

b $10 = (x + 1)^2$

c $x(3x-1) = 10$

Sketching quadratic graphs

Key points

- The graph of the quadratic function $y = ax^2 + bx + c$, where $a \ne 0$, is a curve called a parabola.
- Parabolas have a line of symmetry and a shape as shown.

- To sketch the graph of a function, find the points where the graph intersects the axes.
- To find where the curve intersects the *y*-axis substitute $x = 0$ into the function.
- To find where the curve intersects the *x*-axis substitute $y = 0$ into the function.
- At the turning points of a graph the gradient of the curve is 0 and any tangents to the curve at these points are horizontal.
- To find the coordinates of the maximum or minimum point (turning points) of a quadratic curve (parabola) you can use the completed square form of the function.

Examples

Example 1 Sketch the graph of $y = x^2$.

When $x = 0$, $y = 0^2 - 0 - 6 = -6$ **1** Find where the graph intersects the So the graph intersects the *y*-axis at *y*-axis by substituting $x = 0$. $(0, -6)$ **2** Find where the graph intersects the When $y = 0$, $x^2 - x - 6 = 0$ *x*-axis by substituting $y = 0$. **3** Solve the equation by factorising. 4 Solve $(x + 2) = 0$ and $(x - 3) = 0$. $(x + 2)(x - 3) = 0$ **5** $a = 1$ which is greater $x = -2$ or $x = 3$ than zero, so the graph has the shape: So, *(continued on next page)* the graph intersects the *x*-axis at $(-2, 0)$ **6** To find the turning point, complete and (3, 0) the square. $\left(\frac{1}{2} \right)^2 - \frac{1}{2} - 6$ $\left(x-\frac{1}{2}\right)^2 - \frac{1}{4}$ $x^2 - x - 6 = 0$ **7** The turning point is the minimum $1)^2$ 25 $\left(x-\frac{1}{2}\right)^2 - \frac{25}{4}$ value for this expression and occurs = when the term in the bracket is equal to zero. $\left(\frac{1}{2}\right)^2 = 0$ $\left(x-\frac{1}{2}\right)^2 = 0, \ x = \frac{1}{2}$ When $x = \frac{1}{2}$ and 25 $y = -\frac{25}{4}$, so the turning point is at the $\left(\frac{1}{2},-\frac{25}{4}\right)$ point $\left(\frac{1}{2}, -\frac{25}{4}\right)$ 2^{\degree} 4 u. \overline{o} -2 $-6\frac{1}{4}$) $(\frac{1}{2},$

Example 2 Sketch the graph of $y = x^2 - x - 6$.

Sketching quadratic graphs

Practice

- **1** Sketch the graph of $y = -x^2$.
- **2** Sketch each graph, labelling where the curve crosses the axes. **a** $y = (x + 2)(x - 1)$ **b** $y = x(x - 3)$ **c** $y = (x + 1)(x + 5)$
- **3** Sketch each graph, labelling where the curve crosses the axes. **a** $y = x^2 - x - 6$ **b** $y = x^2 - 5x + 4$ **c** $y = x^2 - 4$ **d** $y = x^2 + 4x$ **e** $y = 9 - x^2$ **f** $y = x$ $y = x^2 + 2x - 3$
- **4** Sketch the graph of $y = 2x^2 + 5x 3$, labelling where the curve crosses the axes.

Extend

- **5** Sketch each graph. Label where the curve crosses the axes and write down the coordinates of the turning point.
	- **a** $y = x^2 5x + 6$ 2 – 5*x* + 6 **b** $y = -x^2 + 7x - 12$ **c** $y = -x^2 + 4x$
- **6** Sketch the graph of $y = x^2 + 2x + 1$. Label where the curve crosses the axes and write down the equation of the line of symmetry.
Solving linear simultaneous equations by elimination

Key points

- Two equations are simultaneous when they are both true at the same time.
- Solving simultaneous linear equations in two unknowns involves finding the value of each unknown which works for both equations.
- Make sure that the coefficient of one of the unknowns is the same in both equations.
- Eliminate this equal unknown by either subtracting or adding the two equations.

Examples

Example 1 Solve the simultaneous equations $3x + y = 5$ and $x + y = 1$

Example 2 Solve $x + 2y = 13$ and $5x - 2y = 5$ simultaneously.

Example 3 Solve $2x + 3y = 2$ and $5x + 4y = 12$ simultaneously.

Video tutorials

Solving simultaneous equations by method of elimination

or click on the QR code to follow the hyperlink

Practice

Solve these simultaneous equations.

1	$4x + y = 8$	2	$3x + y = 7$
$x + y = 5$	$3x + 2y = 5$		
3	$4x + y = 3$	4	$3x + 4y = 7$
$3x - y = 11$	$x - 4y = 5$		

5
$$
2x + y = 11
$$

\n $x - 3y = 9$
\n6 $2x + 3y = 11$
\n $3x + 2y = 4$

Solving linear simultaneous equations by substitution

Key points

• The subsitution method is the method most commonly used for A level. This is because it is the method used to solve linear and quadratic simultaneous equations.

Examples

Example 4 Solve the simultaneous equations $y = 2x + 1$ and $5x + 3y = 14$

Example 5 Solve $2x - y = 16$ and $4x + 3y = -3$ simultaneously.

Video tutorials

Solving simultaneous equations by method of substitution

or click on the QR code to follow the hyperlink

Practice

Solve these simultaneous equations.

Extend

15 Solve the simultaneous equations $3x + 5y - 20 = 0$ and $2(x + y) = \frac{3(y - x)}{y}$.

Solving linear and quadratic simultaneous equations

Key points

- Make one of the unknowns the subject of the linear equation (rearranging where necessary).
- Use the linear equation to substitute into the quadratic equation.
- There are usually two pairs of solutions.

Examples

Example 1 Solve the simultaneous equations $y = x + 1$ and $x^2 + y^2 = 13$

Example 2 Solve $2x + 3y = 5$ and $2y^2 + xy = 12$ simultaneously.

Video tutorials

Solving linear and quadratic simultaneous equations

or click on the QR code to follow the hyperlink

Practice

Solve these simultaneous equations.

1 $y = 2x + 1$ $x^2 + y^2 = 10$ **2** $y = 6 - x$ $x^2 + y^2 = 20$ **3** $y = x - 3$ $x^2 + y^2 = 5$ **4** $y = 9 - 2x$ $x^2 + y^2 = 17$ 5 $y = 3x - 5$ $y = x^2 - 2x + 1$ **6** $y = x - 5$ $y = x^2 - 5x - 12$ **7** $y = x + 5$ $x^2 + y^2 = 25$ **8** $y = 2x - 1$ $x^2 + xy = 24$ **9** $y = 2x$ $y^2 - xy = 8$ 10 $2x + y = 11$ $xy = 15$

Extend

Solving simultaneous equations graphically

Key points

• You can solve any pair of simultaneous equations by drawing the graph of both equations and finding the point/points of intersection.

Examples

Example 1 Solve the simultaneous equations $y = 5x + 2$ and $x + y = 5$ graphically.

Example 2 Solve the simultaneous equations $y = x - 4$ and $y = x^2 - 4x + 2$ graphically.

Video tutorials

Practice

- **1** Solve these pairs of simultaneous equations graphically.
	- **a** $y = 3x 1$ and $y = x + 3$
	- **b** $y = x 5$ and $y = 7 5x$
	- **c** $y = 3x + 4$ and $y = 2 x$
- **2** Solve these pairs of simultaneous equations graphically.
	- **a** $x + y = 0$ and $y = 2x + 6$
	- **b** $4x + 2y = 3$ and $y = 3x 1$
	- **c** $2x + y + 4 = 0$ and $2y = 3x 1$

Hint

Rearrange the equation to make *y* the

- **3** Solve these pairs of simultaneous equations graphically.
	- **a** $y = x 1$ and $y = x^2 4x + 3$
	- **b** $y = 1 3x$ and $y = x^2 3x 3$
	- **c** $y = 3 x$ and $y = x^2 + 2x + 5$
- **4** Solve the simultaneous equations $x + y = 1$ and $x^2 + y^2 = 25$ graphically.

Extend

- **5 a** Solve the simultaneous equations $2x + y = 3$ and $x^2 + y = 4$
	- **i** graphically
	- **ii** algebraically to 2 decimal places.
	- **b** Which method gives the more accurate solutions? Explain your answer.

Linear inequalities

Key points

- Solving linear inequalities uses similar methods to those for solving linear equations.
- When you multiply or divide an inequality by a negative number you need to reverse the inequality sign, e.g. < becomes >.

Examples

Example 1 Solve $-8 \le 4x < 16$

Example 2 Solve $4 \le 5x < 10$

Example 3 Solve $2x - 5 < 7$

Example 4 Solve $2 - 5x \ge -8$

Example 5 Solve $4(x - 2) > 3(9 - x)$

Practice

- **2** Find the set of values of *x* for which $x^2 4x 12 \ge 0$
- **3** Find the set of values of *x* for which $2x^2 7x + 3 < 0$
- **4** Find the set of values of *x* for which $4x^2 + 4x 3 > 0$
- **5** Find the set of values of *x* for which $12 + x x^2 \ge 0$

Extend **Extend**

Find the set of values which satisfy the following inequalities.

- **6** $x^2 + x \le 6$
- **7** $x(2x-9) < -10$
- **8** $6x^2 \ge 15 + x$

Sketching cubic and reciprocal graphs

Key points

• The graph of a cubic function, which can be written in the form $y = ax^3 + bx^2 + cx + d$, where $a \neq 0$, has one of the shapes shown here.

- To sketch the graph of a function, find the points where the graph intersects the axes.
- To find where the curve intersects the *y*-axis substitute $x = 0$ into the function.
- To find where the curve intersects the *x*-axis substitute $y = 0$ into the function.
- Where appropriate, mark and label the asymptotes on the graph.
- Asymptotes are lines (usually horizontal or vertical) which the curve gets closer to but never touches or crosses. Asymptotes usually occur with reciprocal functions.

For example, the asymptotes for the graph of $y = \frac{a}{a}$ *x* are the two axes

(the lines $y = 0$ and $x = 0$).

- At the turning points of a graph the gradient of the curve is 0 and any tangents to the curve at these points are horizontal.
- A double root is when two of the solutions are equal. For example $(x 3)^2(x + 2)$ has a double root at $x = 3$.
- When there is a double root, this is one of the turning points of a cubic function.

Example 1 Sketch the graph of $y = (x - 3)(x - 1)(x + 2)$

To sketch a cubic curve find intersects with both axes and use the key points above for the correct shape.

When $x = 0$, $y = (0 - 3)(0 - 1)(0 + 2)$ **1** Find where the graph intersects the $= (-3) \times (-1) \times 2 = 6$ axes by substituting $x = 0$ and $y = 0$. The graph intersects the *y*-axis at (0, 6) Make sure you get the coordinates the right way around, (*x*, *y*). **2** Solve the equation by solving When $y = 0$, $(x - 3)(x - 1)(x + 2) = 0$ So $x = 3$, $x = 1$ or $x = -2$ *x* − 3 = 0, *x* − 1 = 0 and *x* + 2 = 0 The graph intersects the *x*-axis at (−2, 0), (1, 0) and (3, 0) **3** Sketch the graph. $a = 1 > 0$ so the graph has the shape: \overline{O} for $a > 0$

Example 2 Sketch the graph of $y = (x + 2)^2(x - 1)$

To sketch a cubic curve find intersects with both axes and use the key points above for the correct shape. When $x = 0$, $y = (0 + 2)^2(0 - 1)$ **1** Find where the graph intersects the $= 2^2 \times (-1) = -4$ axes by substituting $x = 0$ and $y = 0$. The graph intersects the *y*-axis at (0, −4) When $y = 0$, $(x + 2)^2(x - 1) = 0$ **2** Solve the equation by solving So $x = -2$ or $x = 1$ *x* + 2 = 0 and *x* − 1 = 0 $(-2, 0)$ is a turning point as $x = -2$ is a double root. The graph crosses the *x*-axis at $(1, 0)$ **3** $a = 1 > 0$ so the graph has the shape: \overline{o} for $a > 0$

\n107 $y=(x-1)^2(x-2)$

10 Sketch the graph of
$$
y = \frac{1}{x+2}
$$

11 Sketch the graph of $y = \frac{1}{x-1}$

Translating graphs

Key points

• The transformation $y = f(x) \pm a$ is a translation of *y* = f(*x*) parallel to the *y*-axis; it is a vertical translation.

As shown on the graph,

- \circ *y* = f(*x*) + *a* translates *y* = f(*x*) up
- \circ *y* = f(*x*) *a* translates *y* = f(*x*) down.
- The transformation $y = f(x \pm a)$ is a translation of *y* = f(*x*) parallel to the *x*-axis; it is a horizontal translation.

As shown on the graph,

- \circ *y* = f(*x* + *a*) translates *y* = f(*x*) to the left
- \circ *y* = f(*x a*) translates *y* = f(*x*) to the right.

Examples

Example 1 The graph shows the function $y = f(x)$. Sketch the graph of $y = f(x) + 2$.

Example 2 The graph shows the function $y = f(x)$. Sketch the graph of $y = f(x - 3)$.

Video tutorials

Transformations of graphs

or click on the QR code to follow the hyperlink

Practice

1 The graph shows the function $y = f(x)$. Copy the graph and on the same axes sketch and label the graphs of $y = f(x) + 4$ and $y = f(x + 2)$.

2 The graph shows the function $y = f(x)$. Copy the graph and on the same axes sketch and label the graphs of $y = f(x + 3)$ and $y = f(x) - 3$.

- **3** The graph shows the function $y = f(x)$. Copy the graph and on the same axes sketch the graph of $y = f(x - 5)$.
- **4** The graph shows the function $y = f(x)$ and two transformations of $y = f(x)$, labelled C_1 and C_2 . Write down the equations of the translated curves C_1 and C_2 in function form.

- **a** Sketch the graph of $y = f(x) + 2$
- **b** Sketch the graph of $y = f(x + 2)$

Stretching graphs

Key points

• The transformation $y = f(ax)$ is a horizontal stretch of $y = f(x)$ with scale factor $\frac{1}{\epsilon}$ $\frac{1}{a}$ parallel to the *x*-axis.

• The transformation $y = f(-ax)$ is a horizontal stretch of $y = f(x)$ with scale factor 1 $\frac{1}{a}$ parallel to the *x*-axis and then a reflection in the *y*-axis.

- The transformation $y = af(x)$ is a vertical stretch of $y = f(x)$ with scale factor a parallel to the *y*-axis.
- The transformation $y = -af(x)$ is a vertical stretch of $y = f(x)$ with scale factor *a* parallel to the *y*-axis and then a reflection in the *x*-axis.

Examples

Example 3 The graph shows the function $y = f(x)$. Sketch and label the graphs of $y = 2f(x)$ and $y = -f(x)$.

Example 4 The graph shows the function $y = f(x)$.

Sketch and label the graphs of *y* = f(2*x*) and *y* = f(–*x*).

Transformations of graphs

- **12** The graph shows the function $y = f(x)$ and a transformation labelled *C*. Write down the equation of the translated curve *C* in function form.
- **13** The graph shows the function $y = f(x)$.
	- **a** Sketch the graph of $y = -f(x)$.
	- **b** Sketch the graph of $y = 2f(x)$.

Extend

- **14 a** Sketch and label the graph of $y = f(x)$, where $f(x) = (x 1)(x + 1)$. **b** On the same axes, sketch and label the graphs of $y = f(x) - 2$ and $y = f(x + 2)$.
- **15 a** Sketch and label the graph of $y = f(x)$, where $f(x) = -(x+1)(x-2)$.
	- **b** On the same axes, sketch and label the graph of $y = f(-\frac{1}{2}x)$.

Key points

- A straight line has the equation $y = mx + c$, where *m* is the gradient and *c* is the *y*-intercept (where $x = 0$).
- The equation of a straight line can be written in the form $ax + by + c = 0$, where a, b and c are integers.
- When given the coordinates (x_1, y_1) and (x_2, y_2) of two points on a line the gradient is calculated using the formula $m = \frac{y_2 - y_1}{y_2 - y_1}$

$$
x_2 - x_1
$$

Examples

Example 1 A straight line has gradient $-\frac{1}{x}$ $\frac{1}{2}$ and *y*-intercept 3.

Write the equation of the line in the form $ax + by + c = 0$.

Example 2 Find the gradient and the *y*-intercept of the line with the equation $3y - 2x + 4 = 0$.

Example 3 Find the equation of the line which passes through the point $(5, 13)$ and has gradient 3.

Example 4 Find the equation of the line passing through the points with coordinates (2, 4) and (8, 7).

Trigonometry in right-angled triangles

Key points

- In a right-angled triangle:
	- o the side opposite the right angle is called the hypotenuse
	- o the side opposite the angle θ is called the opposite
	- o the side next to the angle θ is called the adjacent.
- In a right-angled triangle:
	- o the ratio of the opposite side to the hypotenuse is the sine of angle θ , sin θ = opp hyp
	- o the ratio of the adjacent side to the hypotenuse is the cosine of angle θ , cos $\theta = \frac{\text{adj}}{\sqrt{2\pi}}$
	- o the ratio of the opposite side to the adjacent side is the tangent of angle θ , $tan \theta = \frac{opp}{}$ adj
- If the lengths of two sides of a right-angled triangle are given, you can find a missing angle using the inverse trigonometric functions: sin−1, cos−1, tan−1 .
- The sine, cosine and tangent of some angles may be written exactly.

hyp

A

hypotenuse

adjacent

opposite

Example 1 Calculate the length of side *x*. Give your answer correct to 3 significant figures.

Finding a missing side Finding a missing angle

Practice

1 Calculate the length of the unknown side in each triangle. Give your answers correct to 3 significant figures.

2 Calculate the size of angle *x* in each triangle. Give your answers correct to 1 decimal place.

3 Work out the height of the isosceles triangle. Give your answer correct to 3 significant figures.

Hint:

Split the triangle into two right-angled triangles.

4 Calculate the size of angle *θ*. Give your answer correct to 1 decimal place.

Hint:

First work out the length of the common side to both triangles, leaving your answer in surd form.

5 Find the exact value of *x* in each triangle.

 \overline{x}

The cosine rule

Key points

• *a* is the side opposite angle A. *b* is the side opposite angle B. *c* is the side opposite angle C.

- You can use the cosine rule to find the length of a side when two sides and the included angle are given.
- To calculate an unknown side use the formula $a^2 = b^2 + c^2 2bc \cos A$.
- Alternatively, you can use the cosine rule to find an unknown angle if the lengths of all three sides are given.
- To calculate an unknown angle use the formula $\cos A = \frac{b^2 + c^2 a^2}{2a}$. 2*bc*

Examples

Example 5 Work out the size of angle *θ*. Give your answer correct to 1 decimal place.

Finding a missing side Finding a missing angle

2 Work out the length of the unknown side in each triangle. Give your answers correct to 3 significant figures.

The sine rule

Key points

• *a* is the side opposite angle A. *b* is the side opposite angle B. *c* is the side opposite angle C.

- You can use the sine rule to find the length of a side when its opposite angle and another opposite side and angle are given.
- To calculate an unknown side use the formula $\frac{a}{a}$ sin *A b* sin *B* $=\frac{c}{\cdots}.$ sin*C*
- Alternatively, you can use the sine rule to find an unknown angle if the opposite side and another opposite side and angle are given.
- To calculate an unknown angle use the formula $\frac{\sin A}{\sin A} = \frac{\sin B}{\cos A} = \frac{\sin C}{\cos A}$. *a b c*

Examples

Example 6 Work out the length of side *x*. Give your answer correct to 3 significant figures.

Example 7 Work out the size of angle *θ*. Give your answer correct to 1 decimal place.

or click on the QR code to follow the hyperlink

Finding a missing side Finding a missing angle

5 Find the length of the unknown side in each triangle. Give your answers correct to 3 significant figures.

6 Calculate the angles labelled θ in each triangle. Give your answer correct to 1 decimal place.

- **7 a** Work out the length of QS. Give your answer correct to 3 significant figures.
	- **b** Work out the size of angle RQS. Give your answer correct to 1 decimal place.

Area of a triangle using ½absinC

Key points

- *a* is the side opposite angle A. *b* is the side opposite angle B. *c* is the side opposite angle C.
- The area of the triangle is $\frac{1}{a}$ *absin C*. 2

A \overline{B} \overline{a}

Examples

Example 8 Find the area of the triangle.

Area of a triangle

or click on the QR code to follow the hyperlink

Practice

8 Work out the area of each triangle. Give your answers correct to 3 significant figures.

9 The area of triangle XYZ is 13.3 cm². Work out the length of XZ.

Hint:

Rearrange the formula to make a side the subject.

Extend

10 Find the size of each lettered angle or side. Give your answers correct to 3 significant figures.

For each one, decide whether to use the cosine or sine rule.

11 The area of triangle ABC is 86.7 cm². Work out the length of BC. Give your answer correct to 3 significant figures.
